

DEBBIE

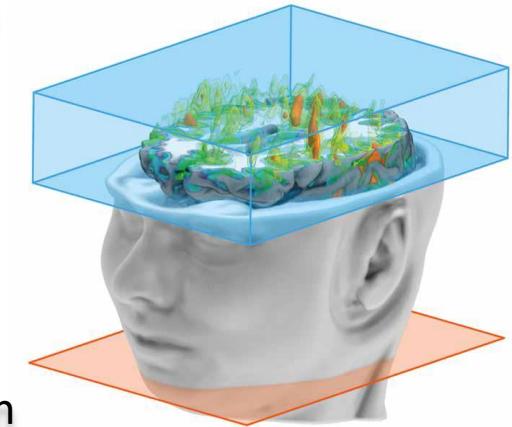

Developing BBB-ASL as non-invasive early biomarker of Alzheimer's disease

EU Joint Programme – Neurodegenerative Disease Research (JPND)
Final Symposium, Brussels, Belgium, 27th - 28th November 2024

DEBBIE project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No. 825664. It is supported through the following funding organisations under the aegis of the EU Joint Program for Neurodegenerative Disease Research (JPND2020-568-106)

DEBBIE-project goal and objectives

Alzheimer's Disease (AD) and Blood-brain barrier (BBB) integrity

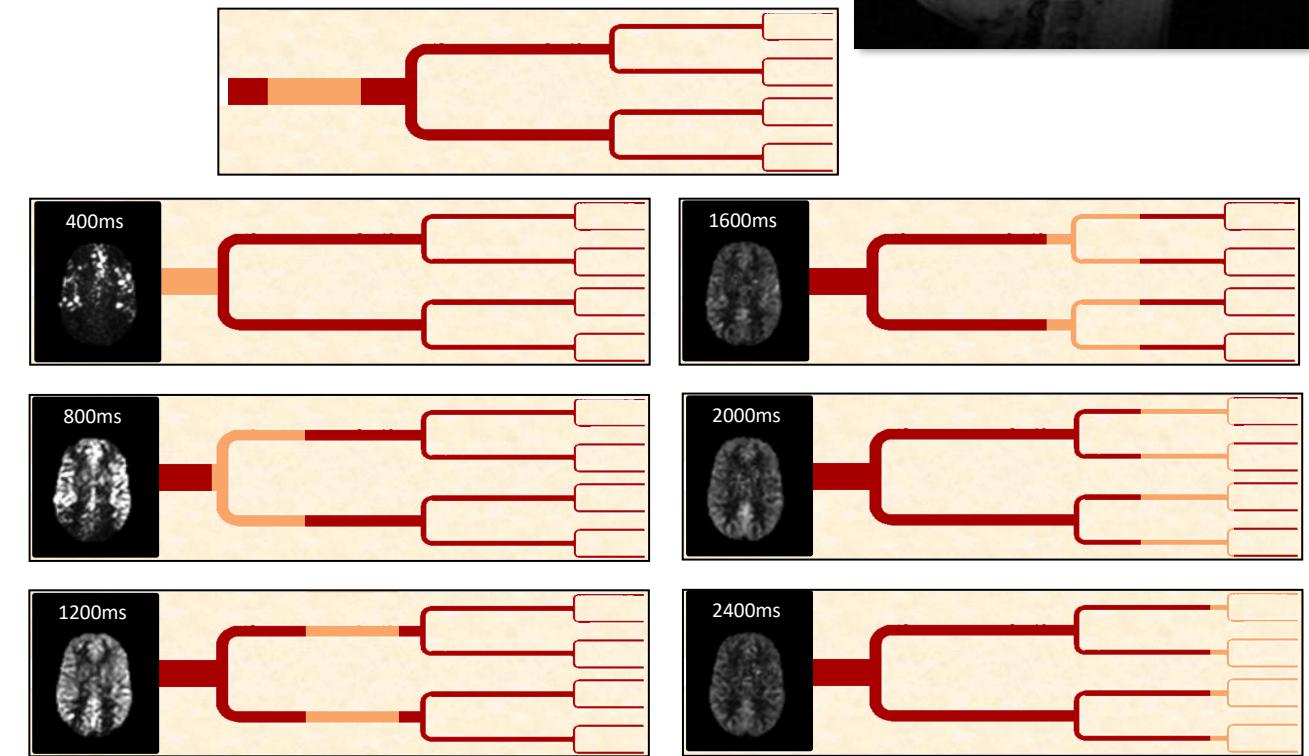

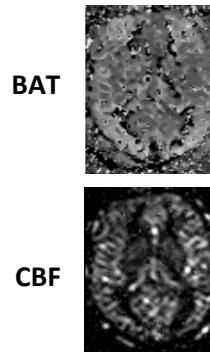

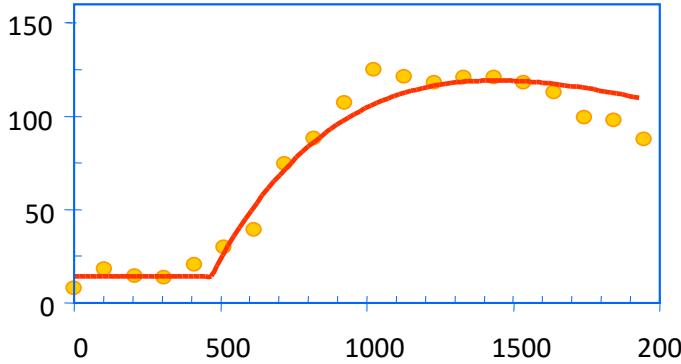

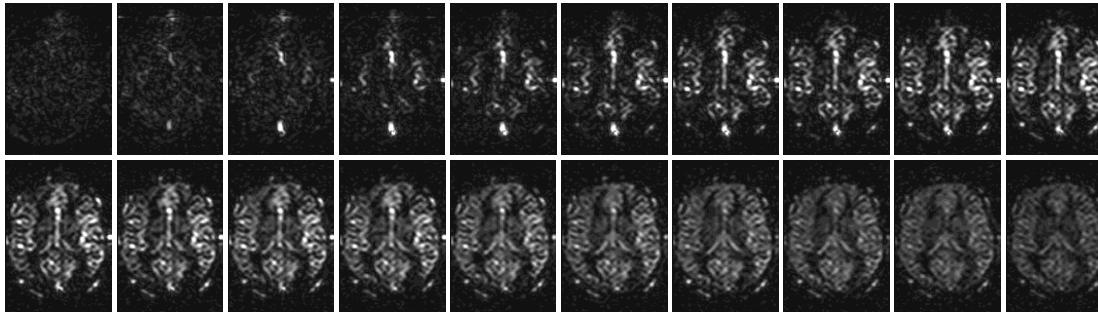

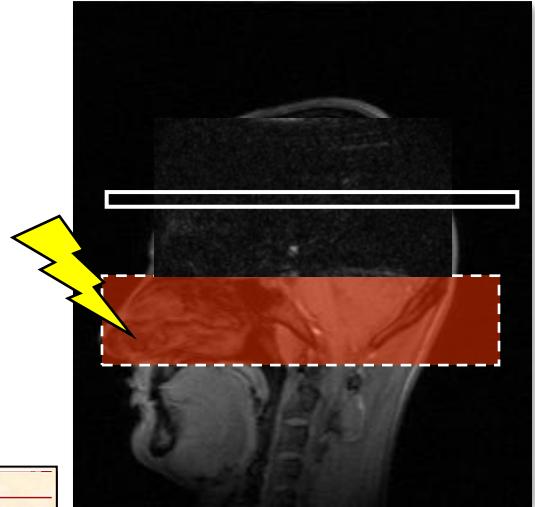

Courtesy: Beatriz Padrela

Physiological imaging: perfusion

Arterial Spin Labeling (ASL)

- Principle:
- preparation of blood upstream
 - imaging downstream after inflow time TI
 - control image without preparation to cancel out tissue signal

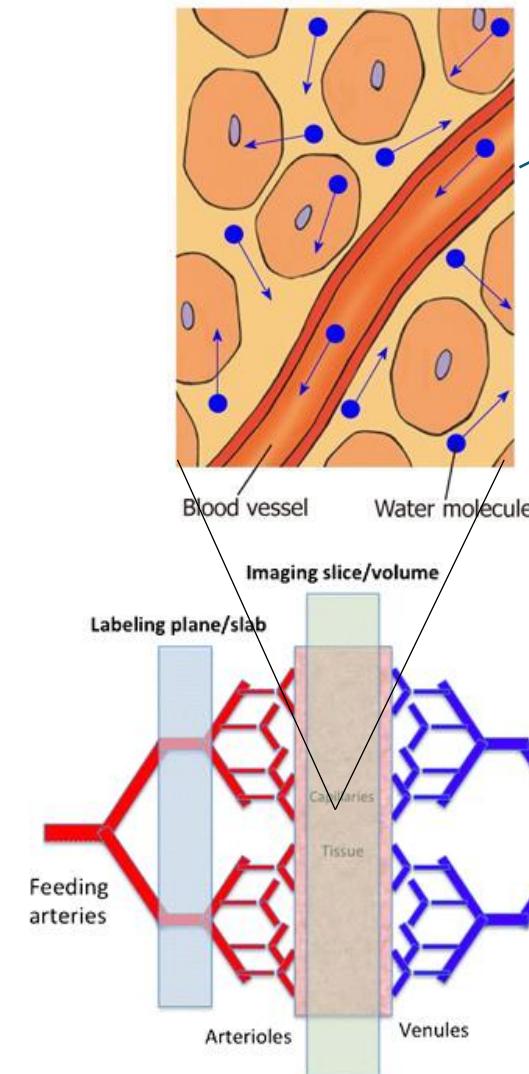

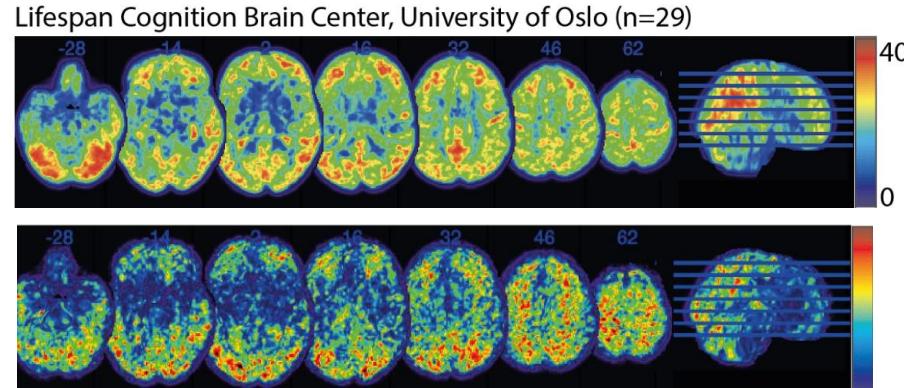

BBB-assessment with ASL

Separate intra and extra-vascular compartments

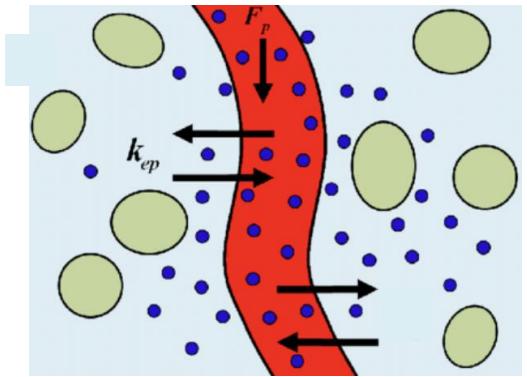

Intra- and extravascular components separated based on their T2 relaxation time

Quantification based on 2-3 compartment model

Mean Tex (ms)

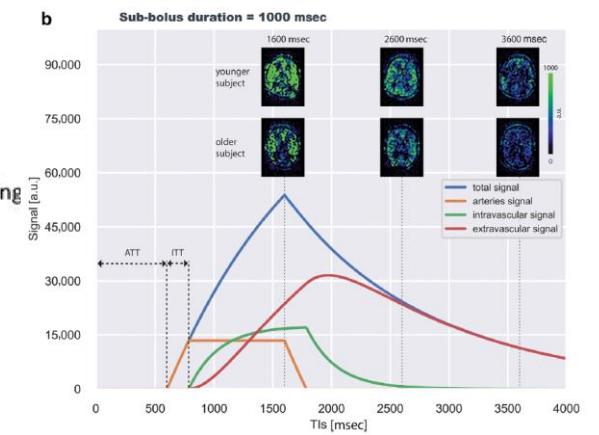

Differences in the T2 relaxation times

Multi-echo ASL

T2 (blood) > T2 (tissue)

Limitations

Current clinical Limitations of using ASL for direct BBB integrity mapping

To create a clinically feasible direct BBB integrity biomarker, the following is lacking:

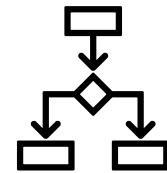

Scan time
(too long)

Calibration
(physiological variation)

Standardization
(data acquisition & image processing)

Interpretation
("healthy BBB")

Validation
(ASL-BBB validation)

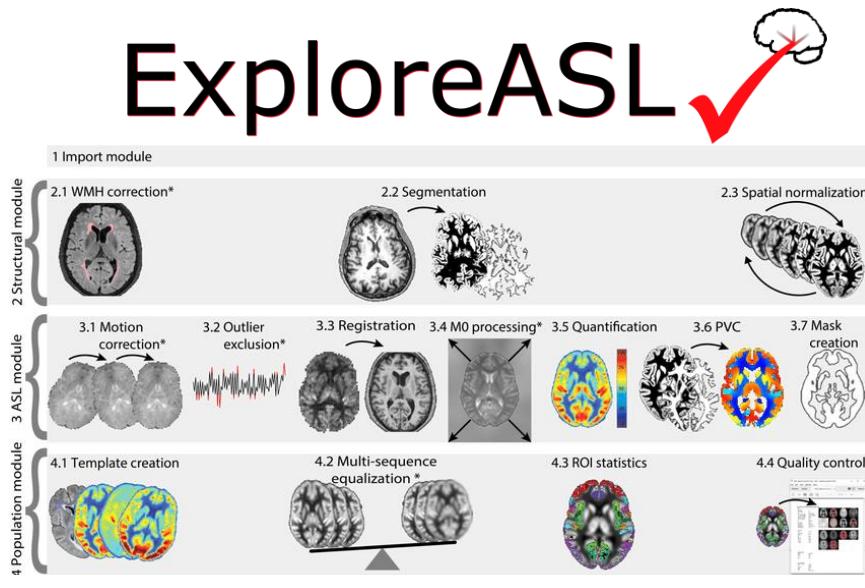

Application
(in clinical context)

Standardization

- Hardware-agnostic sequence development
- Data and image processing

Methodological questions

Clinical questions

DEBBIE-AD project

(Developing BBB-ASL as non-invasive early biomarker of Alzheimer's disease)

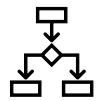

Methodological questions

Why

How

1.A

Reproducibility

Establish reproducibility in healthy controls

50 controls
Age = 55-75

1.B

Accuracy

Compare with gold standard water PET

12 controls + 36 patients
(12 stroke, 12 MCI, 12 AD)
Age = 50-90

1.C

Normal variability

Create a reference atlas of BBB integrity from healthy participants

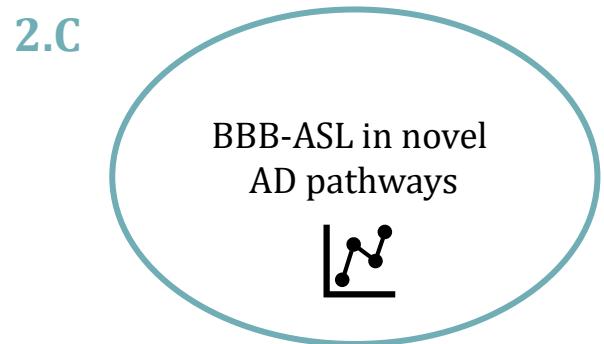

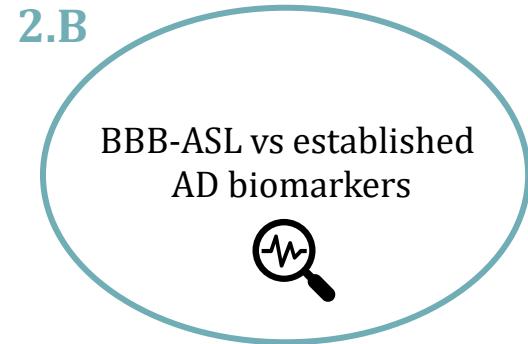

218 controls
Age = 20-90

DEBBIE-AD project

(Developing BBB-ASL as non-invasive early biomarker of Alzheimer's disease)

Clinical questions

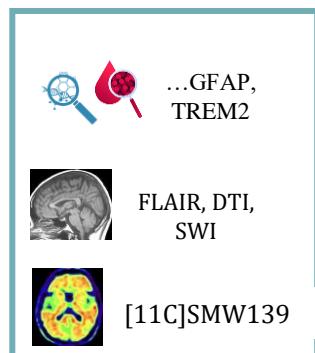

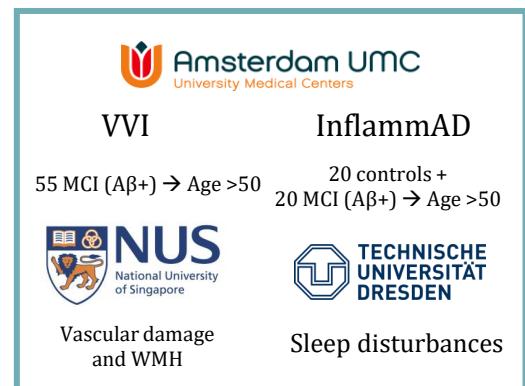

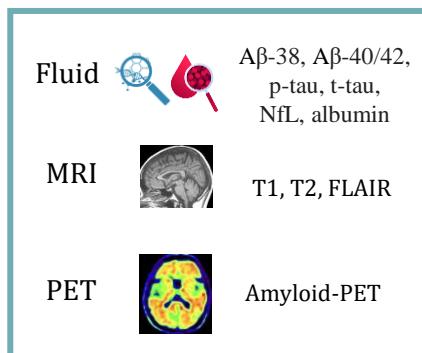

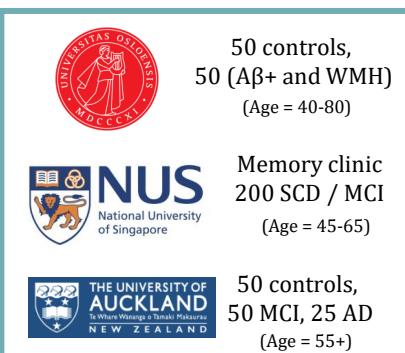

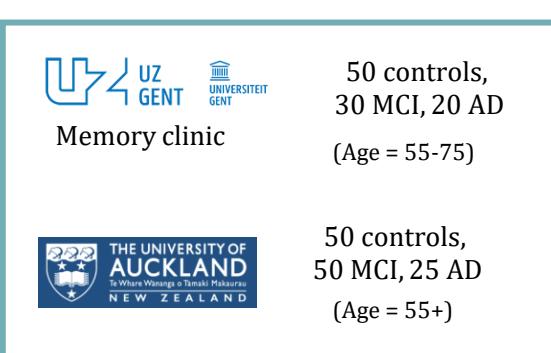

Why

Detect BBB-ASL disruption between healthy controls and AD patients

Investigate if BBB-ASL correlate with the current AD biomarkers

Study the relation of BBB-ASL with novel biomarkers of AD
